Asset Performance and Volatility

Source: Refinitiv Datastream, chart by BlackRock as of October 22, 2019. Note: The bars show the total return in local currency terms except for currencies, gold and copper which are the spot returns. Government bonds are 10-year benchmark issues. Index returns are shown for illustrative purposes only. It is not possible to invest directly in an index. Past performance is not indicative of future results.

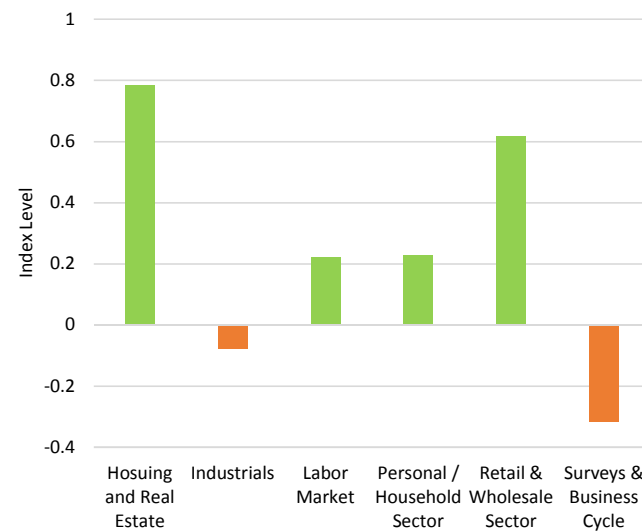

Surprise, Surprise

Economic Surprise Indices

Source for both charts: Bloomberg as of October 23, 2019. Past performance is not a guarantee of future results.

Economic Surprise Sector Snapshot

The **Bloomberg ECO Surprise Index** shows the degree to which economic analysts under-or over-estimate the trends in the business cycle. The surprise element is defined as the percentage (or percentage point) difference between analyst forecasts and the published value of economic data releases.

The **Citi Economic Surprise Indices** measure data surprises relative to market expectations. A positive reading means that data releases have been stronger than expected and a negative reading means that data releases have been worse than expected.

Leverage

Spreads and Credit Quality

Source: Bloomberg, BlackRock as of October 23, 2019. Data derived from the Bloomberg Barclays Corporate Credit Index. Past performance is not a guarantee of future results.. High Quality denotes A rated and above.

Credit Stress Migration

Background and Methodology: Insurers have been adding corporate credit and NAIC 2+ rated credit in search of yield. However, the early 2000's recession drove the worst recent period of Moody's credit rating downgrades.

The **2001-2003 ratings migration experience** anchors a stress of YE2018 public and private credit to answer "what happens to credit quality" and "what are the implications for risk-based capital?" We observe:

- NAIC 1, A3-rated bond is 5.4x more likely to get downgraded to NAIC 2 vs. an NAIC 1, A1-rated bond (31.7% vs. 5.9%)
- NAIC 2, Baa3-rated bond is 3.4x more likely to get downgraded to NAIC 3 vs. a NAIC 2, Baa1-rated bond (22.7% vs. 6.6%)

BlackRock's insurer portfolio stress model:

- analyzes portfolio impact – ratings migration and expected losses
- assess implications to RBC, including regulatory intervention
- estimate capital infusion needed to restore pre-stress RBC

Corporate Credit – Cumulative Ratings Transition and Default Assumptions (Moody's 2001 -2003)

Applying Moody's 2001-2003 Cumulative Ratings Transition and Default Experience to YE 2018 Public Corporate Credit
Net change from pre-stress ratings mix to post-stress ratings mix for Public Corporate Credit (IG, HY and Bank Loan corporates)

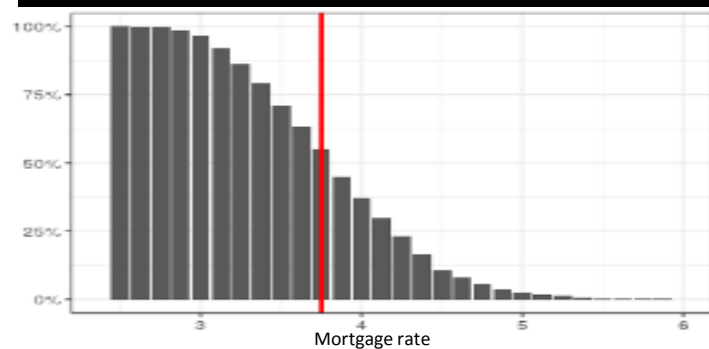

Source: Moody's Annual Default Study: Corporate Default and Recovery Rates 1983-2001/2002/2003, BlackRock analysis. Assumes no change in price as a result of the downgrade; had price impacts been included the post-stress ratings mix would have changed, so the net change by rating would have changed.
