## ?

## LIFE EXPECTANCY AND CHANGING DEMOGRAPHICS

U.S. mortality rates and life expectancies have improved dramatically over the long term. The aggregate, age-adjusted death rate (per 1,000 population) has fallen from 17.9 in 1940 to 8.4 in 2021 (Table 12.1). The death rate among males dropped from 19.8 to 10.1 , and among females, from 16.0 to 6.9 over this period. The crude death rate for 2021 is 10.4 (Table 12.3).

Life expectancy at age 25 is currently 50.5 years for males and 55.7 years for females in 2020 (Table 12.2). A man who retired in 2020 at age 65 could expect to live 17.0 years more on average, while a 65 -year-old woman could expect to live another 19.8 years.

Examining trend data for life expectancy over the past century yields startling contrasts. A 25 -year-old during 1900-02 could expect to live 39.1 years more vs. 53.0 additional years for a 25 -year-old in 2020. Because of increased longevity, Table 12.2 has been extended to include life expectancy for men and women at age 100 after 1997.

## Changing Demographics

Ownership of life insurance products is driven by many factors, including demographics. A disproportionately young and dependent population is more likely to drive demand for life insurance, whereas a disproportionately older population is more likely to drive sales of annuities and long-term care insurance. Similarly, a population with few working people would have less need for disability income insurance.

The number of people in the United States who are age 19 or younger has either declined or remained flat in every year since 2012 until 2022 (Table 12.4). There are currently 81.1 million people in that age group, compared to 82.5 million in 2012. Similarly, the number of those age 65 or older has been rapidly increasing. There are currently 57.8 million seniors (those age 65 and over) in the United States. Since 2012, the number of seniors increased by 34 percent, or 14.7 million. When coupled with those approaching retirement (age 50 to 64), the percent of those in or approaching retirement totals 120.7 million, or 36.2 percent of the population (Table 12.5).

    Notes: Alaska and Hawaii are included as of 1959. For decennial periods prior to 1929-31, data represent death registration states only: 1900-02 and 1909-11, 10 states and the District of Columbia; 1919-21, 34 states and the District of Columbia. Beginning with 1970, data exclude deaths of nonresidents of the United States.
