

3

LIABILITIES

The liabilities of U.S. life insurers primarily comprise the reserves held by each insurer to back its obligations to policyholders and their beneficiaries. Of the many different kinds of reserves, policy and asset fluctuation reserves are the most important. Liabilities also include small amounts of other funds and obligations.

Based on standard accounting principles applied to all businesses, total liabilities plus the company's net value must equal its total assets. Net value is a company's surplus plus its capital stock and is available to support policyholder claims if necessary.

POLICY RESERVES

Policy reserves concern an insurer's obligation to its customers arising from its product in force. State law requires each company to maintain its policy reserves at a level that will assure payment of all policy obligations as they fall due. That level is calculated on an actuarial basis, taking into account funds from future premium payments, assumed future interest earnings, and expected mortality experience. At the end of 2024, policy reserves of U.S. life insurers totaled \$6.6 trillion, 4.4 percent higher than 2023 (Table 3.1).

Policy reserves are held and identified for each type of business conducted by a life insurer:

- Life insurance policies
- Annuities and supplementary contracts
- Health insurance policies

The composition of life insurer policy reserves has changed over the years, reflecting a shift in the basic types of business undertaken. Annuity contract reserves now account for a larger proportion of total policy reserves, while reserves set aside for life insurance policies have a lesser share.

In 2024, reserves for life insurance comprised 29 percent of total policy reserves, at \$1.9 trillion (Figure 3.2, Table 3.2). This proportion has shrunk from 1980, when life insurance products commanded 51 percent of total reserves (Table 3.7). In 2024, these reserves consisted of \$1.7 trillion for individual life policies, \$203 billion for group policies, and less than \$1 billion for credit life policies (Table 3.2).

By contrast, reserves for annuities and supplementary contracts climbed to two-thirds of total reserves in 2024 (66%), or \$4.3 trillion, from 46 percent in 1980.

Much of the increase reflects the strong growth in retirement plans administered by life insurers.

In 2024, annuity reserves consisted of \$3 trillion for individual annuities, up 4.8 percent from 2023, and \$1.3 trillion for group annuities, up 4.4 percent. General account annuity reserves increased 2.4 percent while separate account annuity reserves increased 6.6 percent (Table 3.2).

Reserves held under supplementary contracts with life contingencies in 2024 totaled \$28 billion, and for health insurance policies, \$296 billion.

DEPOSIT-TYPE CONTRACTS

Contracts issued by life insurers that do not incorporate mortality or morbidity risks are known as deposit-type contracts. Benefit payments under these contracts are not contingent upon death or disability as they are in life and disability insurance contracts, or upon continued survival as they are in annuity contracts. Categories of deposit-type contracts, as defined by the National Association of Insurance Commissioners (NAIC), include GICs, supplementary contracts without life contingencies, annuities certain, premium and other deposit funds, dividend and coupon accumulations, lottery payouts, and structured settlements.

Under codified statutory accounting practices implemented in 2001, cash inflows and outflows on deposit-type contracts are no longer reported as income and expenditure. Instead, they are recorded directly as increasing or decreasing reserves. During 2024, \$433 billion was deposited to these contracts and \$395 billion was withdrawn, with a total reserve of \$830 billion at year's end (Table 3.3).

In 2024, premium and other deposit funds remained the largest category of the deposit-type business with \$267 billion in deposits, \$265 billion in payments, and \$358 billion in reserve at year-end. GICs received \$143 billion from policyholders and paid out \$103 billion in 2024, leaving a reserve of \$352 billion at year's end.

ASSET FLUCTUATION RESERVES

Besides policy reserves, insurers are required to establish two statutory reserves to absorb gains and losses in their invested assets.

The asset valuation reserve (AVR) absorbs both realized and unrealized, credit-related capital gains and losses. The AVR consists of a default component, which provides for credit-related losses on fixed-income assets, and an equity component, which provides for all types of equity investments.

The interest maintenance reserve (IMR) captures all realized, interest-related capital gains and losses on fixed-income assets. The IMR amortizes these gains and losses into income over the remaining life of the investments sold.

In 2024, the industry's total AVR increased 4.5 percent to \$104 billion, and its IMR decreased 31.2 percent to \$10 billion (Table 3.1).

OTHER LIABILITIES

In addition to reserves, other liability funds of U.S. life insurers at the end of 2024 included \$64 billion in policy and contract claims; \$23 billion set aside for the following year's dividend payments to policyholders; and \$1.1 trillion for liabilities not directly allocable to

policyholders—incurred expenses, mandatory reserves for fluctuations in security values, and insurance premiums paid in advance, for example (Table 3.1).

SURPLUS FUNDS AND CAPITAL STOCK

Surplus and capital amounted to \$524 billion for U.S. life insurers at the end of 2024 (Table 3.1). Surplus funds provide extra reserve safeguards for such contingencies as an unexpected rise in death rates among policyholders, unusual changes in the value of securities, and general protection for policy obligations. Several factors influence the amount of surplus that a life insurer retains, including company size, kinds of insurance written, mortality experience, general business conditions, and government regulation. Capital refers to the total par value of shares of the companies' capital stock.

CAPITAL RATIOS

One measure of the adequacy of a life insurer's surplus is its capital ratio: surplus funds plus capital stock plus AVR as a percentage of general account assets. Theoretically, the higher the capital ratio, the better a company is able to withstand adverse investment and mortality experience. However, the type of company and the distribution of its book of business can make comparisons among companies and with an industry wide average much less meaningful. In 2024, the aggregate capital ratio of U.S. life insurers was 10.5 percent (Table 3.4).

Life insurance regulators created the risk-based capital (RBC) ratio to monitor life insurance company solvency. Risk-based capital, calculated according to an NAIC model law, is considered the minimum

amount of capital an insurer needs to avoid triggering regulatory action. The RBC ratio is total adjusted capital divided by risk-based capital, for a threshold ratio of 100 percent. The ratio provides a means for evaluating the adequacy of an insurer's capital relative to the risks inherent in the insurer's operations.

From 1993 when life insurers began reporting risk-based capital, the average RBC ratio rose steadily to a plateau of 290 percent in 1997, which remained unbroken until 2001. That year, the ratio jumped to 346 percent, mainly due to two changes enacted by NAIC: accounting codification and an adjusted RBC formula that reflects changed risks for assets. The ratio reached its peak of 489 percent in 2014 and declined until it reached 424 in 2018. From 2023 to 2024, the ratio decreased 2 percentage points to 434 (Table 3.5).

Most companies have an RBC ratio well above the regulatory minimum level of 100 percent. By year-end 2024, 663 companies, or 94.8 percent of life insurers, had a ratio of 200 percent or more. These companies carried 99.6 percent of the industry's total assets.

Source: ACLI tabulations of National Association of Insurance Commissioners (NAIC) data, used by permission.

Notes: NAIC does not endorse any analysis or conclusions based on use of its data. Before 1947, the business of health insurance departments of life insurers was not included in this series. Codification effective with 2001 Annual Statement filings changed the reporting of annuities.

Data represent U.S. life insurers and, as of 2003, fraternal benefit societies.

* Included with group annuities.

¹ Beginning in 2001, excludes reserves for guaranteed interest contracts (GICs). Figures for GICs are shown in Table 3.3.

² Beginning in 2001, includes reserves for supplementary contracts with life contingencies; reserves for supplementary contracts without life contingencies are included in liabilities for deposit-type contracts in Table 3.3.

Source: ACLI tabulations of National Association of Insurance Commissioners (NAIC) data, used by permission.

Notes: NAIC does not endorse any analysis or conclusions based on use of its data. Credit life insurance is limited to insurance on loans of 10 years' or less duration. Prior to 1973, all credit insurance was included in the individual and group categories. Data represent U.S. life insurers and, as of 2003, fraternal benefit societies.

Source: ACLI tabulations of National Association of Insurance Commissioners (NAIC) data, used by permission.

Notes: NAIC does not endorse any analysis or conclusions based on use of its data. Codification effective with 2001 Annual Statement filings changed the reporting of annuities and deposit-type funds, as explained in footnotes. Data represent U.S. life insurers and, as of 2003, fraternal benefit societies.

NA: Not available.

¹ Prior to 2001, represents policyholder dividend accumulations. Beginning in 2001, includes liabilities for guaranteed interest contracts, supplementary contracts without life contingencies, policyholder dividend accumulations, and premium and other deposits.

² Prior to 1993, included with other obligations.

³ Beginning in 1992, asset valuation reserve replaced mandatory securities valuation reserve.

Table 3.10

Capital Ratios of Life Insurers, by Year (percent)					
Year	Including MSVR/AVR	Excluding MSVR/AVR	Year	Including MSVR/AVR	Excluding MSVR/AVR
1970	9.7	8.6	2006	10.0	8.6
1975	8.1	7.4	2007	10.3	8.9
1980	9.2	7.7	2008	8.7	8.1
1985	9.1	7.7	2009	9.7	9.1
1990	8.5	7.3	2010	10.1	9.2
1991	9.3	7.9	2011	9.9	8.8
1992	9.6	8.1	2012	10.4	9.2
1993	10.0	8.4	2013	10.4	9.2
1994	10.2	8.6	2014	10.6	9.3
1995	10.7	9.0	2015	10.7	9.5
1996	11.9	10.0	2016	10.6	9.4
1997	10.6	8.7	2017	10.6	9.3
1998	11.0	9.0	2018	10.6	9.3

Notes: NAIC does not endorse any analysis or conclusions based on use of its data. Capital ratio is equal to capital plus surplus plus the asset valuation reserve (AVR), or mandatory securities valuation reserve (MSVR) prior to 1992, divided by general account assets. Data represent U.S. life insurers and, as of 2003, fraternal benefit societies.
